

Supplementary Material 2. Descriptions of the Representative high-resolution computed tomography (HRCT) images. HRCT images of the temporal bone used in the study. (a-c) Sequential coronal sections and (d-f) axial sections demonstrating, a fluid-soft tissue lesion is observed on the left side, causing erosion of the tympanic tegmentum and ossicular chain, and filling the middle ear and mastoid antrum. The right ear was completely normal. These images served as the standardized input for GPT-5 and Gemini 2.5 Pro evaluations.
